How to connect to SFTP in Python

Learn how to connect to SFTP, list files, upload and download using Python

#Guides #Engineering

With the purpose of secure file and data transfer, SFTP has been a top choice for many users. While it is an efficient and user friendly protocol, engaging with an SFTP server from a programming language such as Python may take a tad more deciphering. With the guidance of the following post, we hope you will come out the other side feeling familiar and ready to utilize and connect to SFTP from Python.

Run and Monitor Scheduled Tasks on your Favorite Apps

Cron To Go simplifies the monitoring, alerting, and management of your cron jobs' performance, uptime, and status - ensuring seamless operation.

Try Cron To Go for free!

Requirements

Prior to jumping in, some setup is required. We'll use the 'pysftp' package to connect and pass commands to the SFTP server. When you are ready to install it, manually run:

```
1 | pip install pysftp
```

Or create a requirements.txt file and declare your dependencies within. Then, save the following as requirements.txt:

```
1 | pysftp==0.2.9
```

Then run:

```
1 | pip install -r requirements.txt
```

Connecting to SFTP

In this post, we'll be using an environment variable named `SFTPTOGO_URL` that contains all the information required to connect to an SFTP server using a URL format: `sftp://user:password@host`. The variable is parsed to extract the URL parts using `'urlparse'`, and the remote server's host key is verified by default using `~/ssh/known_hosts`.

Once the connection is established, the SFTP client object will be assigned to the variable: `connection`.

```
1 | import pysftp
2 | from urllib.parse import urlparse
3 | import os
4 |
5 |
6 | class Sftp:
7 |     def __init__(self, hostname, username, password, port=22):
8 |         """Constructor Method"""
9 |         # Set connection object to None (initial value)
10 |         self.connection = None
11 |         self.hostname = hostname
12 |         self.username = username
13 |         self.password = password
14 |         self.port = port
15 |
16 |     def connect(self):
17 |         """Connects to the sftp server and returns the sftp connection object"""
18 |
19 |         try:
20 |             # Get the sftp connection object
21 |             self.connection = pysftp.Connection(
22 |                 host=self.hostname,
23 |                 username=self.username,
24 |                 password=self.password,
25 |                 port=self.port,
26 |             )
27 |         except Exception as err:
28 |             raise Exception(err)
29 |         finally:
30 |             print(f"Connected to {self.hostname} as {self.username}.")
31 |
32 |
33 |     def disconnect(self):
34 |         """Closes the sftp connection"""
35 |         self.connection.close()
36 |         print(f"Disconnected from host {self.hostname}")
```

Listing Files

Now that the connection is all set up, we can use it to list files on the remote SFTP server. This is achieved by calling the connection object's `listdir` function or the `listdir_attr` function. Either one of these functions can take a remote path argument or, if omitted, will list the files and directories in the current remote directory. The `listdir` function returns a list of filenames (as string), while the `listdir_attr` function returns a list of SFTPAttributes objects containing the file size, creation, modification timestamps and permissions, in addition to the file name. In our example, our wrapper function returns a generator, allowing the function caller to iterate over the returned files.

```
1 | def listdir(self, remote_path):
2 |     """Lists all the files and directories in the specified path and returns
3 |     for obj in self.connection.listdir(remote_path):
4 |         yield obj
5 |
6 |
7 | def listdir_attr(self, remote_path):
8 |     """Lists all the files and directories (with their attributes) in the spe
9 |     for attr in self.connection.listdir_attr(remote_path):
10 |         yield attr
```

Upload File

The next step is to upload a file. Use the connection object's `put` function and pass the path to the local file and the remote path, which is also where the file should end up by the end of the upload. The function call would look like: `connection.put("./local.txt", "./remote.txt")`

```
1 | def upload(self, source_local_path, remote_path):
2 |     """
3 |     Uploads the source files from local to the sftp server.
4 |     """
5 |
6 |     try:
7 |         print(
8 |             f"uploading to {self.hostname} as {self.username} [(remote path:
9 |         )
10 |
11 |         # Download file from SFTP
12 |         self.connection.put(source_local_path, remote_path)
13 |         print("upload completed")
14 |
15 |     except Exception as err:
16 |         raise Exception(err)
```

Download File

The last job left for us to complete is downloading our files. Use the connection object's `get` function, and pass the path to the remote file and the local path, where you would store the downloaded file. You would call the function like so: `connection.get("./remote.txt", "./download.txt")`

```
1 | def download(self, remote_path, target_local_path):
2 |     """
3 |     Downloads the file from remote sftp server to local.
4 |     Also, by default extracts the file to the specified target_local_path
5 |     """
6 |
7 |     try:
8 |         print(
9 |             f"downloading from {self.hostname} as {self.username} [(remote pa
10 |         )
11 |
12 |         # Create the target directory if it does not exist
13 |         path, _ = os.path.split(target_local_path)
14 |         if not os.path.isdir(path):
15 |             try:
16 |                 os.makedirs(path)
17 |             except Exception as err:
18 |                 raise Exception(err)
19 |
20 |         # Download from remote sftp server to local
21 |         self.connection.get(remote_path, target_local_path)
22 |         print("download completed")
23 |
24 |     except Exception as err:
25 |         raise Exception(err)
```

The Whole Thing

So we've made it to the finish line! If you would like to run the entire program from start to finish, copy the following code and save it as `main.py`:

```
1 | import pysftp
2 | from urllib.parse import urlparse
3 | import os
4 |
5 |
6 | class Sftp:
7 |     def __init__(self, hostname, username, password, port=22):
8 |         """Constructor Method"""
9 |         # Set connection object to None (initial value)
10 |         self.connection = None
11 |         self.hostname = hostname
12 |         self.username = username
13 |         self.password = password
14 |         self.port = port
15 |
16 |     def connect(self):
17 |         """Connects to the sftp server and returns the sftp connection object"""
18 |
19 |         try:
20 |             # Get the sftp connection object
21 |             self.connection = pysftp.Connection(
22 |                 host=self.hostname,
23 |                 username=self.username,
24 |                 password=self.password,
25 |                 port=self.port,
26 |             )
27 |         except Exception as err:
28 |             raise Exception(err)
29 |         finally:
30 |             print(f"Connected to {self.hostname} as {self.username}.")
31 |
32 |
33 |     def disconnect(self):
34 |         """Closes the sftp connection"""
35 |         self.connection.close()
36 |         print(f"Disconnected from host {self.hostname}")
37 |
38 |     def listdir(self, remote_path):
39 |         """Lists all the files and directories in the specified path and returns
40 |         for obj in self.connection.listdir(remote_path):
41 |             yield obj
42 |
43 |     def listdir_attr(self, remote_path):
44 |         """Lists all the files and directories (with their attributes) in the spe
45 |         for attr in self.connection.listdir_attr(remote_path):
46 |             yield attr
47 |
48 |     def download(self, remote_path, target_local_path):
49 |         """
50 |         Downloads the file from remote sftp server to local.
51 |         Also, by default extracts the file to the specified target_local_path
52 |         """
53 |
54 |         try:
55 |             print(
56 |                 f"downloading from {self.hostname} as {self.username} [(remote pa
57 |             )
58 |
59 |             # Create the target directory if it does not exist
60 |             path, _ = os.path.split(target_local_path)
61 |             if not os.path.isdir(path):
62 |                 try:
63 |                     os.makedirs(path)
64 |                 except Exception as err:
65 |                     raise Exception(err)
66 |
67 |             # Download from remote sftp server to local
68 |             self.connection.get(remote_path, target_local_path)
69 |             print("download completed")
70 |
71 |         except Exception as err:
72 |             raise Exception(err)
73 |
74 |     def upload(self, source_local_path, remote_path):
75 |         """
76 |         Uploads the source files from local to the sftp server.
77 |         """
78 |
79 |         try:
80 |             print(
81 |                 f"uploading to {self.hostname} as {self.username} [(remote path:
82 |             )
83 |
84 |             # Download file from SFTP
85 |             self.connection.put(source_local_path, remote_path)
86 |             print("upload completed")
87 |
88 |         except Exception as err:
89 |             raise Exception(err)
90 |
91 | if __name__ == "__main__":
92 |     sftp_url = os.environ.get("SFTPTOGO_URL")
93 |
94 |     if not sftp_url:
95 |         print("First, please set environment variable SFTPTOGO_URL and try again.
96 |         exit(0)
97 |
98 |     parsed_url = urlparse(sftp_url)
99 |
100 |     sftp = Sftp(
101 |         hostname=parsed_url.hostname,
102 |         username=parsed_url.username,
103 |         password=parsed_url.password,
104 |     )
105 |
106 |     # Connect to SFTP
107 |     sftp.connect()
108 |
109 |     # Lists files with attributes of SFTP
110 |     path = "/"
111 |     print(f"List of files with attributes at location {path}:")
112 |     for file in sftp.listdir_attr(path):
113 |         print(file.filename, file.st_mode, file.st_size, file.st_atime, file.st_m
114 |
115 |     # Upload files to SFTP location from local
116 |     local_path = "/Users/saggi/Downloads/tls2.png"
117 |     remote_path = "~/tls2.png"
118 |     sftp.upload(local_path, remote_path)
119 |
120 |     # Lists files of SFTP location after upload
121 |     print(f"List of files at location {path}:")
122 |     print([f for f in sftp.listdir(path)])
123 |
124 |     # Download files from SFTP
125 |     sftp.download(
126 |         remote_path, os.path.join(remote_path, local_path + '.backup')
127 |     )
128 |
129 |     # Disconnect from SFTP
130 |     sftp.disconnect()
```

Finally, run it using the command:

```
python main.py
```

Congratulations on connecting to SFTP using Python!

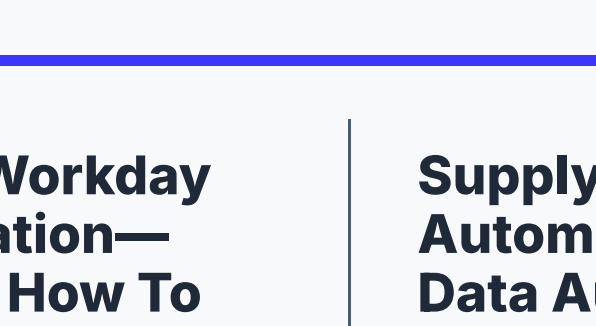

Cloud FTP with maximum security and reliability

SFTP To Go offers managed cloud storage service - highly available, reliable and secure. Great for companies of any size, any scale.
